Does Copyright increase Creative production?

To try and answer this question it is separated into two main questions below.

- Do Economic Rights (ER) increase creative output?
- Does Attribution increase creative output?

Existing Arguments on Copyright

The research presented will be discussed in light of two opposing arguments about the effectiveness of copyright.

Existing Arguments on Copyright

The research presented will be discussed in light of two opposing arguments about the effectiveness of copyright.

- Landes & Posner argue that authors would have insufficient incentive to create if copyright law did not exist (Landes & Posner, 1989).

Existing Arguments on Copyright

The research presented will be discussed in light of two opposing arguments about the effectiveness of copyright.

- Landes & Posner argue that authors would have insufficient incentive to create if copyright law did not exist (Landes & Posner, 1989).
- Boldrin & Levine argue that intellectual property rights stifle innovation and are mainly used as tools for rent seeking (Boldrin & Levine, 2013).

Context for Economic Rights and Attribution

There are two quotes which give some context to the issues discussed.

Context for Economic Rights and Attribution

There are two quotes which give some context to the issues discussed.

"There is no such thing as a free lunch."

-Milton Friedman

Context for Economic Rights and Attribution

There are two quotes which give some context to the issues discussed.

"There is no such thing as a free lunch."

-Milton Friedman

"Man is least himself when he talks in his own person. Give him a mask, and he will tell you the truth."

- Oscar Wilde

Existing Literature

There is existing work on copyright incentives and attribution, although there is a distinct lack of empirical evidence regarding the effectiveness of copyright (Atiq 2013, Howe 2013).

Existing Literature

There is existing work on copyright incentives and attribution, although there is a distinct lack of empirical evidence regarding the effectiveness of copyright (Atiq 2013, Howe 2013).

In Buccafusco et al 2014 the authors tested whether higher copyright thresholds would spur creativity and found that this was true for high copyright thresholds.

Existing Literature

There is existing work on copyright incentives and attribution, although there is a distinct lack of empirical evidence regarding the effectiveness of copyright (Atiq 2013, Howe 2013).

In Buccafusco et al 2014 the authors tested whether higher copyright thresholds would spur creativity and found that this was true for high copyright thresholds.

Sprigman et al 2015 looked into whether attribution was valuable for the author and found that they were willing to accept a lower price for their work if they could gain attribution rights.

Market Description

Creative markets are, to a large extent, winner takes all markets. Examples include the publishing and music industry (Kretschmer and Hardwick 2007, Kretschmer 2012).

Professional authors the median income in the UK was 12.330, 64% of the national gross median wage, and in Germany it as 42% of the median income (Kretschmer and Hardwick 2007).

Creators Market Decisions

Taking the perspective of a creator one can maximise their chances of "winning" or gaining rewards by focusing on the quantity and quality of the creation.

There is a natural trade-off between quantity and quality, assuming there are scarce resources, such as, time or money.

Thus to maximise the chance to "winning" in the market place an individual will choose between the two.

There were two creativity tasks used.

- 1 Divergent thinking task (Torrance, 1962)
- 2 Figural Task (Wallach and Kogan 1962, Zeng et al 2011)

Divergent Task (Both Rights)

Time Left: 2:08

Alternative Objects Task

Come up with as many alternative objects for a stapler as possible.

You will have 7 minutes to complete the task.

You can add a new entry by clicking on the new entry button

Title: _____

Description: _____

New Entry

Group entries

Author: Elton John > Robot legs

Could be used as legs of a robot

Author: John Legend > Paper weight

use it to hold down papers

Author: Lionel Richie > Gun

can shoot staples at people

Author: John Mayor > Toy

Kids can use it during play time

Author: Dave Matthews > Piercer

To pierce the skin

Figural Task (Neither Right)

Time Left: 3:24

Alternative Objects Figural Task

Come up with as many alternative objects for the figure below as possible.

You will have 7 minutes to complete the task.

You can add a new entry by clicking on the new entry button

Title: Progress

Description: A figure as a metaphor for progress in my PhD

New Entry

Group entries

string

a piece of string on the table

Wave

It could be a wave in the ocean

Participant Results (Both Rights)

Results Summary

Here you can see you performance with respect to ther other participants within your group:

Rank	Participant	Stars	Score	Pay
1	John Mayor	** 1 ** 0 ** 0 * 0 * 0 **	5	£5.55
2	Dave Matthews	** 0 ** 1 ** 0 * 0 * 0 **	4	£2.1
3	Lionel Richie	** 0 ** 0 ** 1 * 0 * 0 **	3	£1
4	Elton John	** 0 ** 0 ** 0 * 1 * 0 **	2	£0.5
5	John Legend	** 0 ** 0 ** 0 * 0 * 1 **	1	£0

Continue

Participant Results (Neither Right)

Results Summary

Here you can see your performance with respect to the other participants within your group:

Rank	Participant	Stars	Score
1	Jaakko Miettinen	*** 0 ** 1 ** 0 * 1 * 0	6

Continue

Similarities Instructions

Instructions for Similarity rounds

This round is completely anonymous and will not affect your pay.

A list of ideas will be shown and you are to judge whether any two are similar. If a similarity identified more than once, the later entry will be disregarded in following stages.

Similarity guidelines:

1. Ideas are exact copies of each other.
2. Idea is largely expressed in an existing entry.

Ideas should be originally expressed and not be simply rewordings of each other

Example:

The following is a similarity judging example, but the final decision is up to you. Consider the task: "come up with alternative object for a coat hanger":

1.	Back Scratcher Bent to scratch the back	Similar to:	2	▼
2.	Leg Scratcher Bent to scratch the leg	Similar to:	1	▼
3.	Reaching tool Moulded in order to reach high places	Similar to:		▼

- 1 and 2 express the same idea similarly and are seen as similar.
- 3 expresses a similar idea differently and so is not similar to the first two.

Favourites rounds

You will be asked to name your 5 favourites ideas by giving them stars.

You will be completely anonymous when giving stars.

The amount of stars an individual receives for his/her ideas will determine his/her rank within their group.

1.	Reset button pressing tool A tool that can be used to press reset buttons which cannot be pressed with your fingers

Per Idea Subjective Scores

Recap of Results

Results suggest that overall there is a strategic decision being made based on the quantity and quality of submissions in the divergent task.

Recap of Results

Results suggest that overall there is a strategic decision being made based on the quantity and quality of submissions in the divergent task.

Whether the effect is due to the type of creativity or due to a learning effect or time is unclear. For future research the order of the tasks can be randomly allocated.

Recap of Results

Results suggest that overall there is a strategic decision being made based on the quantity and quality of submissions in the divergent task.

Whether the effect is due to the type of creativity or due to a learning effect or time is unclear. For future research the order of the tasks can be randomly allocated.

There is evidence that economic rights and attribution work as substitutes in when considering the number of ideas created.

Recap of Results

Whether the effect is due to the type of creativity or due to a learning effect or time is unclear. For future research the order of the tasks can be randomly allocated.

There is evidence that economic rights and attribution work as substitutes in when considering the number of ideas created.

The End

Thank you!

Extrinsic Motivation

Creativity is a process which requires a heuristic or open-ended approach compared to algorithmic tasks which have a single obvious solution (Amabile 2012)

If extrinsic motivators administered in a controlling way it could decrease intrinsic motivation and thus performance but if it is constructive and recognizes people's competence the effect on creative performance would more likely be positive (Amabile 2012)

It is important to look into the interplay between intrinsic and extrinsic motivation as external incentives can crowd out intrinsic ones (Frey and Oberholzer-Gee 1997, Amabile 2012)

Intrinsic Motivation & Creation

There is agreement in psychology literature that intrinsic motivation is an important part, if not the most important part, of motivating creativity (Amabile 1997, Morningstar 2012, Grant and Berry 2012).

Intrinsic motivation being the motivation that comes from within an individual. Which is said to be more important to artists compared to other professions (Frey and Oberholzer-Gee 1997)

It is also theorised that the reason artists create is the need for self expression (Abbing 2012).
